Linear Regression

① $y = ax + c$

```
import numpy as np
import matplotlib.pyplot as plt
```

```
x = np.array([1, 2, 3, 4, 5])
y = np.array([1.2, 1.8, 2.6, 3.2, 3.8])
```

```
x, y = np.
```

```
Slope, intercept = np.polyfit(x, y, 1)
```

```
print("Intercept: {intercept}, Slope: {Slope}");
```

```
x_input = float(input("Enter value of x:"))
```

```
y_pred = Slope * x_input + intercept
```

```
print("Predicted y: {y_pred}")
```

⇒ Intercept: 0.5400...

Slope: 0.659

Enter a value for x: 7

predicted y: 5.159 //

$$\hat{p} = [(X^T X)^{-1} X^T] y$$

→ Linear regression using Matrix form.

```
import numpy as np
import matplotlib.pyplot as plt
```

```
x = np.array([1, 2, 3, 4, 5])
y = np.array([1.2, 1.8, 2.6, 3.2, 3.8])
```

```
X_b = np.c_[np.ones((X.shape[0], 1)), X]
```

```
theta = np.linalg.pinv(X_b.T.dot(X_b)).dot(X_b.T).dot(y)
```

```
intercept, slope = theta
```

```
print(intercept)
print(slope)
```

```
x_input = float(input("Enter a value of x"))
x_input_b = np.array([1, x_input])
y_pred = x_input_b.dot(theta)
# p. 7
```

```
print("Predicted y for x =",
      x_input, ":", y_pred)
```

⇒ Intercept: 0.540

Slope: 0.66 [theta 1]

Enter a value of x to predict y: 7

Predicted y for x: 7.0: 5.160
